

# Module Interface Specification for EOMEE

Gabriela Sánchez Díaz

December 13, 2020

# 1 Revision History

Date	Version	Notes
20-11-2020	1.0	MIS first draft

## 2 Symbols, Abbreviations and Acronyms

See SRS Documentation at [SRS](#).

Additionally, the following abbreviations were used:

abbreviation	description
$N$	Number of electrons
orthog	Matrix orthogonalization method
tol	Tolerance
nspino	Number of spin orbital basis
lhs	Left-hand-side
rhs	Right-hand-side
neigs	Number of eigenvalues

### 3 Introduction

The following document details the Module Interface Specifications of EOMEE, a set of tools to implement and solve the Equation-of-Motion methods for excited states.

Complementary documents include the System Requirement Specifications and Module Guide. The full documentation and implementation can be found at <https://github.com/gabrielasd/eomee/tree/cas741>.

### 4 Notation

The structure of the MIS for modules comes from Hoffman and Strooper (1995), with the addition that template modules have been adapted from Ghezzi et al. (2003). The mathematical notation comes from Chapter 3 of Hoffman and Strooper (1995). For instance, the symbol  $:=$  is used for a multiple assignment statement and conditional rules follow the form  $(c_1 \Rightarrow r_1 | c_2 \Rightarrow r_2 | \dots | c_n \Rightarrow r_n)$ .

The following table summarizes the primitive data types used by EOMEE.

Data Type	Notation	Description
character	char	a single symbol or digit
integer	$\mathbb{Z}$	a number without a fractional component in $(-\infty, \infty)$
natural number	$\mathbb{N}$	a number without a fractional component in $[1, \infty)$
real	$\mathbb{R}$	any number in $(-\infty, \infty)$

The specification of EOMEE uses some derived data types: sequences, strings, and tuples. Sequences are lists filled with elements of the same data type. Strings are sequences of characters. Tuples contain a list of values, potentially of different types. In addition, EOMEE uses functions, which are defined by the data types of their inputs and outputs. Local functions are described by giving their type signature followed by their specification.

The following simplifications will be made in the mathematical notation for the sake of understandability:

- $\text{seq}(l_1, l_2, \dots, l_n; T)$ , will be used instead of sequence  $[l_1, l_2, \dots, l_n]$  of type  $T$ . For example  $\text{seq}(n, m; \mathbb{R})$ , where  $n, m > 0$ , would map to sequence  $[n, m]$  of type  $\mathbb{R}$ . This type will generally be used to indicate NumPy.ndarray data types.
- Variables that are of type sequence will be denoted in bold font, i.e, the parameter **R** denotes a sequence.
- Subscripts will be used for indexing sequences, for instance,  $x_i$  will represent the  $i$ th element of **x**, the same as  $x[i]$  from Hoffman and Strooper (1995).

- str will be used instead of string.
- bool will be used instead of boolean.
- EOMT will be used to define an element belonging to the EOM methods set {EOMIP, EOMEA, EOMExc, EOMDIP, EOMDEA},

Also, the absence of value will be defined by Python’s data type NoneType, denoted as None.

## 5 Module Decomposition

The following table is taken directly from the Module Guide document for this project.

Level 1	Level 2	Level 3
Hardware-Hiding Module		
	Control	
	Input	
	Integrals	
Behaviour-Hiding Module	RDMs	
	EOM Interface	IP EOM; EA EOM; DIP EOM; DEA EOM; Excitation EOM
	Output	
Software Decision Module	Solver	

Table 1: Module Hierarchy

## 6 MIS of Control Module

### 6.1 Module

main

### 6.2 Uses

input (7), Integrals (8), WfnRDMs (9), EOMIP (11), EOMEA (12), EOMExc (13), EOMDIP (14), EOMDEA (15), solver (17), output (16)

### 6.3 Syntax

#### 6.3.1 Exported Constants

None

#### 6.3.2 Exported Access Programs

Name	In	Out	Exceptions
main	str	-	-

### 6.4 Semantics

#### 6.4.1 State Variables

None

#### 6.4.2 Environment Variables

None

#### 6.4.3 Assumptions

None

#### 6.4.4 Access Routine Semantics

main():

- transition: The following steps are performed:
  - Get a file containing the input parameters from the user (inputFile).
  - Parse the file's content and verify all required input parameters are present:  
parse\_inputfile(inputFile)  
check\_inputs(ParsedParams)

- Load and verify the electron integrals ( $\mathbf{h}, \mathbf{v}$ ) and RDMs ( $\boldsymbol{\gamma}, \boldsymbol{\Gamma}$ ):  
Integrals( $\mathbf{h}, \mathbf{v}$ )  
WfnRDMs( $\boldsymbol{\gamma}, \boldsymbol{\Gamma}$ )
- Define an EOM type equation from the parameters  $\mathbf{h}, \mathbf{v}, \boldsymbol{\gamma}$  and  $\boldsymbol{\Gamma}$ .  
EOMT( $\mathbf{h}, \mathbf{v}, \boldsymbol{\gamma}, \boldsymbol{\Gamma}$ )
- Solve the EOM eigenvalue problem and evaluate the TDMs  
 $\Delta E, \mathbf{C} := \text{solve.dense}(\text{EOMT.lhs}, \text{EOMT.rhs}, \text{ortog}, \text{tol})$
- Evaluate the TDMs:  
 $\mathbf{T} := \text{EOMT.tdm}(\mathbf{C})$
- Output the results of the computations:  
output(filename1,  $\Delta E, \mathbf{C}, \mathbf{T}$ )

- exception: None

#### 6.4.5 Local Functions

None

## 7 MIS of Input Module

### 7.1 Module

input

### 7.2 Uses

None

### 7.3 Syntax

#### 7.3.1 Exported Constants

#### 7.3.2 Exported Access Programs

Name	In	Out	Exceptions
parse_inputfile	str	ParsedParams	FileNotFoundError
check_inputs	ParsedParams	-	FileNotFoundError, ValueError
N		$(n1, n2 : \mathbb{N})$	
one_int_file		str	
two_int_file		str	
dm1_file		str	
dm2_file		str	
eom		str	
orthog		str	
tol		$\mathbb{R}$	

### 7.4 Semantics

#### 7.4.1 State Variables

$N: \mathbb{N} \vee (n1, n2 : \mathbb{N})$

one\_int\_file: str

two\_int\_file: str

dm1\_file: str

dm2\_file: str

eom: str  $\in \{“ip”, “dip”, “ea”, “dea”, “exc”\}$  which selects the EOMT

orthog: str  $\in \{“symmetric”, “asymmetric”\}$

tol:  $\mathbb{R} > 0$

### 7.4.2 Environment Variables

inputFile: string representing a file or file path.

### 7.4.3 Assumptions

The first function called will be `parse_infile`, followed by `check_inputs`.

### 7.4.4 Access Routine Semantics

`parse_infile(filename)`:

- transition: The input file *filename* is read sequentially and the state variables get assigned
- output: *out* := ParsedParams
- exception: FileNotFoundError

`check_inputs(ParsedParams)`:

- output: None
- exception: *exc* :=

$\neg(N \in (n1, n2 : \mathbb{N}))$	$\Rightarrow$ TypeError
"one_int_file" not in working directory	$\Rightarrow$ FileNotFoundError
"two_int_file" not in working directory	$\Rightarrow$ FileNotFoundError
"dm1_file" not in working directory	$\Rightarrow$ FileNotFoundError
"dm2_file" not in working directory	$\Rightarrow$ FileNotFoundError
$\neg(eom \in \{"ip", "dip", "ea", "dea", "exc"\})$	$\Rightarrow$ ValueError
$\neg(orthog \in \{"symmetric", "asymmetric"\})$	$\Rightarrow$ ValueError
$\neg(tol \in \mathbb{R})$	$\Rightarrow$ TypeError
$\neg(tol > 0)$	$\Rightarrow$ ValueError

ParsedParams.N:

- output: *out* := N
- exception: None

ParsedParams.tol:

- output: *out* := tol
- exception: None

ParsedParams.orthog:

- output: *out* := orthog
- exception: None

ParsedParams.eom:

- output: *out* := eom
- exception: None

ParsedParams.one\_int\_file:

- output: *out* := one\_int\_file
- exception: None

ParsedParams.two\_int\_file:

- output: *out* := two\_int\_file
- exception: None

ParsedParams.dm1\_file:

- output: *out* := dm1\_file
- exception: None

ParsedParams.dm2\_file:

- output: *out* := dm2\_file
- exception: None

#### 7.4.5 Local Functions

None

## 8 MIS of Integrals Module

### 8.1 Template Module

Integrals

### 8.2 Uses

input (7)

### 8.3 Syntax

#### 8.3.1 Exported Constants

#### 8.3.2 Exported Access Programs

Name	In	Out	Exceptions
new Integrals	str, str	Integrals	-
<b>h</b>	-	$\text{seq}(m, m : \mathbb{R})$	-
<b>v</b>	-	$\text{seq}(m, m, m, m : \mathbb{R})$	-
nspino	-	$\mathbb{N}$	-

### 8.4 Semantics

#### 8.4.1 State Variables

**h**:  $\text{seq}(m, m : \mathbb{R})$

**v**:  $\text{seq}(m, m, m, m : \mathbb{R})$

nspino:  $\mathbb{N}$

#### 8.4.2 Environment Variables

intfile1: binary file in NumPy .npy format.

intfile2: binary file in NumPy .npy format.

#### 8.4.3 Assumptions

The constructor of Integrals will be called before any state variable is invoked.

#### 8.4.4 Access Routine Semantics

new Integrals(one\_int\_file, two\_int\_file):

- transition: Call `load_integrals(one_int_file, two_int_file)`
- output: `out := self`

- exception: None

Integrals.h:

- output:  $out := \mathbf{h}$
- exception: None

Integrals.v:

- output:  $out := \mathbf{v}$
- exception: None

Integrals.nspino:

- output:  $out := \text{nspino}$
- exception: None

#### 8.4.5 Local Functions

load\_integrals(one\_int\_file, two\_int\_file):

- transition:  
Read the binary files one\_int\_file and two\_int\_file  
verify\_integrals()  
If no exception is raised, assign the state variables  $\mathbf{h}$  and  $\mathbf{v}$
- exception:  $exc := \text{FileNotFoundError}$

verify\_integrals():

- output:  $out := \text{None}$
- exception:  $exc :=$

$\neg(\mathbf{h} \in \text{sequence of } \mathbb{R})$	$\Rightarrow \text{TypeError}$	
$\neg(\mathbf{v} \in \text{sequence of } \mathbb{R})$	$\Rightarrow \text{TypeError}$	
$\mathbf{h}$ is not a bidimensional array	$\Rightarrow \text{ValueError}$	
$\mathbf{v}$ is not a 4 dimensional array	$\Rightarrow \text{ValueError}$	
$\neg( \mathbf{h}[0]  =  \mathbf{v}[0] )$	$\Rightarrow \text{ValueError}$	
$\neg(h_{ij} = h_{ji})$	$\Rightarrow \text{ValueError}$	
$\neg((v_{ijkl} = v_{jilk}) \wedge (v_{ijkl} = v_{klij}))$	$\Rightarrow \text{ValueError}$	
$\neg((v_{ijkl} = -v_{jikl}) \wedge (v_{ijkl} = -v_{ijlk}))$	$\Rightarrow \text{ValueError}$	

## 9 MIS of RDMS Module

### 9.1 Template Module

WfnRDMS

### 9.2 Uses

input (7)

### 9.3 Syntax

#### 9.3.1 Exported Constants

#### 9.3.2 Exported Access Programs

Name	In	Out	Exceptions
new WfnRDMS	$\mathbb{Z} \vee (n1, n2 : \mathbb{Z}), \text{ str},$ str	WfnRDMS	-
$\gamma$	-	$\text{seq}(m, m : \mathbb{R})$	-
$\Gamma$	-	$\text{seq}(m, m, m, m : \mathbb{R})$	-
N	-	$(n1, n2 : \mathbb{N})$	-
nspino	-	$\mathbb{N}$	-

### 9.4 Semantics

#### 9.4.1 State Variables

nspino:  $(n1, n2 : \mathbb{N})$

nspino:  $\mathbb{N}$

$\gamma$ :  $\text{seq}(m, m : \mathbb{R})$ , where  $0 \leq \gamma_{ij} \leq 1$

$\Gamma$ :  $\text{seq}(m, m, m, m : \mathbb{R})$ , where  $0 \leq \Gamma_{ijkl} \leq 1$

#### 9.4.2 Environment Variables

file1: binary file in NumPy .npy format.

file2: binary file in NumPy .npy format.

#### 9.4.3 Assumptions

The constructor of WfnRDMS will be called before invoking any state variable.

#### 9.4.4 Access Routine Semantics

new WfnRDMS(n1, dm1\_file, dm2\_file):

- transition:  
   $N := n1$   
  Call `assign_rdms(dm2_file, dm2_file)`
- output:  $out := self$
- exception: None

WfnRDMS.dm1:

- output:  $out := \gamma$
- exception: None

WfnRDMS.dm2:

- output:  $out := \mathbf{\Gamma}$
- exception: None

WfnRDMS.N:

- output:  $out := N$
- exception: None

WfnRDMS.nspino:

- output:  $out := nspino$
- exception: None

#### 9.4.5 Local Functions

`assign_rdms(dm1_file, dm2_file)`:

- transition: Read the binary files `dm1_file` and `dm2_file`.  
  `verify_rdms()`  
  If no exception is raised, assign the state variables  $\gamma$  and  $\mathbf{\Gamma}$
- exception:  $exc := FileNotFoundError$

`verify_rdms()`:

- output:  $out := None$
- exception:  $exc :=$

$\neg(\boldsymbol{\gamma} \in \text{sequence of } \mathbb{R})$	$\Rightarrow \text{TypeError}$	
$\neg(\boldsymbol{\Gamma} \in \text{sequence of } \mathbb{R})$	$\Rightarrow \text{TypeError}$	
$\boldsymbol{\gamma}$ is not a bidimensional array	$\Rightarrow \text{ValueError}$	
$\boldsymbol{\Gamma}$ is not a 4 dimensional array	$\Rightarrow \text{ValueError}$	
$\neg(\gamma_{ij} = \gamma_{ji})$	$\Rightarrow \text{ValueError}$	
$\neg(\Gamma_{ijkl} = \Gamma_{jilk}) \vee \neg(\Gamma_{ijkl} = \Gamma_{klij})$	$\Rightarrow \text{ValueError}$	
$\neg(\Gamma_{ijkl} = -\Gamma_{jikl}) \vee \neg(\Gamma_{ijkl} = -\Gamma_{ijlk})$	$\Rightarrow \text{ValueError}$	
$\text{Tr}(\boldsymbol{\gamma}) \neq N$	$\Rightarrow \text{ValueError}$	
$\text{Tr}(\boldsymbol{\Gamma}) \neq N(N - 1)$	$\Rightarrow \text{ValueError}$	

## 10 MIS of EOM Base Module

### 10.1 Interface Module

EOMBase

### 10.2 Uses

None

### 10.3 Syntax

#### 10.3.1 Exported Constants

None

#### 10.3.2 Exported Access Programs

Name	In	Out	Exceptions
neigs	-	$\mathbb{N}$	NotImplementedError
compute_tdm	$\text{seq}(k, k: \mathbb{R})$	$\text{seq}(k, m, m: \mathbb{R})$	NotImplementedError
lhs	-	$\text{seq}(k, k: \mathbb{R})$	-
rhs	-	$\text{seq}(k, k: \mathbb{R})$	-
nspino	-	$\mathbb{N}$	-
<b>h</b>	-	$\text{seq}(m, m: \mathbb{R})$	-
<b>v</b>	-	$\text{seq}(m, m, m, m: \mathbb{R})$	-
<b><math>\gamma</math></b>	-	$\text{seq}(m, m: \mathbb{R})$	-
<b><math>\Gamma</math></b>	-	$\text{seq}(m, m, m, m: \mathbb{R})$	-

### 10.4 Semantics

#### 10.4.1 State Variables

nspino:  $\mathbb{N}$

**h**:  $\text{seq}(m, m: \mathbb{R})$

**v**:  $\text{seq}(m, m, m, m: \mathbb{R})$

**$\gamma$** :  $\text{seq}(m, m: \mathbb{R})$

**$\Gamma$** :  $\text{seq}(m, m, m, m: \mathbb{R})$

lhs: `_compute_lhs()`

rhs: `_compute_rhs()`

#### 10.4.2 Assumptions

The EOMBase module can't be instantiated, it is inherited by EOMIP, EOMEA, EOMExc, EOMDIP and EOMDEA.

### 10.4.3 Access Routine Semantics

EOMBase.nspino:

- output:  $out := \text{nspino}$
- exception: None

EOMBase.h:

- output:  $out := \mathbf{h}$
- exception: None

EOMBase.v:

- output:  $out := \mathbf{v}$
- exception: None

EOMBase.dm1:

- output:  $out := \gamma$
- exception: None

EOMBase.dm2:

- output:  $out := \mathbf{\Gamma}$
- exception: None

EOMBase.lhs:

- output:  $out := \text{lhs} \in \text{seq}(m, m : \mathbb{R})$
- exception: ValueError

EOMBase.rhs:

- output:  $out := \text{rhs} \in \text{seq}(m, m : \mathbb{R})$
- exception: ValueError

### 10.4.4 Local Functions

`_compute_lhs()`:

- exception: NotImplementedError

`_compute_rhs()`:

- exception: NotImplementedError

#### 10.4.5 Considerations

EOMBase is an abstract class (ABC) defining an interface for the different EOM methods (Subsections (11), (12), (13), (14) and (15)). Each state variable has a corresponding access program. Only the methods *neigs*, `compute_tdm`, `_compute_lhs` and `_compute_rhs` are abstract.

## 11 MIS of EOM IP Module

### 11.1 Template Module

EOMIP inherits EOMBase

### 11.2 Uses

EOMBase (10), Integrals (8), WfnRDMs (9)

### 11.3 Syntax

#### 11.3.1 Exported Constants

None

#### 11.3.2 Exported Access Programs

Name	In	Out	Exceptions
new EOMIP	$\text{seq}(m, m : \mathbb{R}),$ $\text{seq}(m, m, m, m : \mathbb{R}),$ $\text{seq}(m, m : \mathbb{R}),$ $\text{seq}(m, m, m, m : \mathbb{R})$	EOMIP	-

### 11.4 Semantics

#### 11.4.1 State Variables

nspino:  $\mathbb{N}$

**h**:  $\text{seq}(m, m : \mathbb{R})$

**v**:  $\text{seq}(m, m, m, m : \mathbb{R})$

**$\gamma$** :  $\text{seq}(m, m : \mathbb{R})$

**$\Gamma$** :  $\text{seq}(m, m, m, m : \mathbb{R})$

lhs: `_compute_lhs()`

rhs: `_compute_rhs()`

#### 11.4.2 Environment Variables

None

#### 11.4.3 Assumptions

The EOMIP constructor is called before any other access program in the class.

#### 11.4.4 Access Routine Semantics

new EOMIP( $\mathbf{h}, \mathbf{v}, \text{dm1}, \text{dm2}$ ):

- transition:  $\mathbf{h}, \mathbf{v}, \boldsymbol{\gamma}, \boldsymbol{\Gamma} := \mathbf{h}, \mathbf{v}, \text{dm1}, \text{dm2}$ ,  
   $lhs := \_compute\_lhs()$   
   $rhs := \_compute\_rhs()$   
   $nspino := |\mathbf{h}[0]|$

- output:  $out := self$

- exception: None

neigs():

- output:  $out := |\mathbf{h}[0]|$
- exception: None

compute\_tdm( $\mathbf{C}$ ):

- output:  $out := \sum_n \gamma_{mn} c_n, \{n : \mathbb{Z} | 0 \leq n < nspino\}$
- exception: None

#### 11.4.5 Local Functions

$\_compute\_lhs()$ :

- output:  $out :=$   
   $-\mathbf{h}\boldsymbol{\gamma} + 0.5 \sum_{qrs} v_{qnrs} \Gamma_{mqr s}$
- exception: None

$\_compute\_rhs()$ :

- output:  $out := \boldsymbol{\gamma}$
- exception: None

## 12 MIS of EOM EA Module

### 12.1 Template Module

EOMEA inherits EOMBase

### 12.2 Uses

EOMBase (10), Integrals (8), WfnRDMs (9)

### 12.3 Syntax

#### 12.3.1 Exported Constants

None

#### 12.3.2 Exported Access Programs

Name	In	Out	Exceptions
new	$\text{seq}(m, m : \mathbb{R})$ ,	EOMEA	-
EOMEA	$\text{seq}(m, m, m, m : \mathbb{R})$ , $\text{seq}(m, m : \mathbb{R})$ , $\text{seq}(m, m, m, m : \mathbb{R})$		

### 12.4 Semantics

#### 12.4.1 State Variables

nspino:  $\mathbb{N}$

**h**:  $\text{seq}(m, m : \mathbb{R})$

**v**:  $\text{seq}(m, m, m, m : \mathbb{R})$

**$\gamma$** :  $\text{seq}(m, m : \mathbb{R})$

**$\Gamma$** :  $\text{seq}(m, m, m, m : \mathbb{R})$

*lhs*: `_compute_lhs()`

*rhs*: `_compute_rhs()`

#### 12.4.2 Environment Variables

None

#### 12.4.3 Assumptions

The EOMEA constructor is called before any other access program in that class.

#### 12.4.4 Access Routine Semantics

new EOMEA(h,v,dm1,dm2):

- transition:  $\mathbf{h}, \mathbf{v}, \boldsymbol{\gamma}, \boldsymbol{\Gamma} := \mathbf{h}, \mathbf{v}, \mathbf{dm1}, \mathbf{dm2}$ ,  
 $lhs := \_compute\_lhs()$ ,  
 $rhs := \_compute\_rhs()$   
 $nspino := |\mathbf{h}[0]|$

- output:  $out := self$

- exception: None

neigs():

- output:  $out := |\mathbf{h}[0]|$
- exception: None

compute\_tdm( $\mathbf{C}$ ):

- output:  $out := \sum_n (\delta_{mn} - \gamma_{mn}) c_n, \{n : \mathbb{Z} | 0 \leq n < nspino\}$
- exception: None

#### 12.4.5 Local Functions

$\_compute\_lhs()$ :

- output:  $out :=$   
 $\mathbf{h} - \mathbf{h}\boldsymbol{\gamma} + \sum_{ps} v_{mpns} \gamma_{ps} + 0.5 \sum_{pqs} v_{pqns} \Gamma_{pqsm}$
- exception: None

$\_compute\_rhs()$ :

- output:  $out := \mathbf{I} - \boldsymbol{\gamma}$ , where  $\mathbf{I}$  represents the identity matrix
- exception: None

## 13 MIS of EOM Excitation Module

### 13.1 Template Module

EOMExc inherits EOMBase

### 13.2 Uses

EOMBase (10), Integrals (8), WfnRDMs (9)

### 13.3 Syntax

#### 13.3.1 Exported Constants

None

#### 13.3.2 Exported Access Programs

Name	In	Out	Exceptions
new EOMExc	$\text{seq}(m, m : \mathbb{R}),$ $\text{seq}(m, m, m, m : \mathbb{R}),$ $\text{seq}(m, m : \mathbb{R}),$ $\text{seq}(m, m, m, m : \mathbb{R})$	EOMExc	-

### 13.4 Semantics

#### 13.4.1 State Variables

nspino:  $\mathbb{N}$

**h**:  $\text{seq}(m, m : \mathbb{R})$

- exception: None

\_compute\_rhs():

- output:  $out := \delta_{li} \gamma_{kj} - \boldsymbol{\Gamma}$
- exception: None

## 14 MIS of EOM DIP Module

The MIS of EOM DIP is equivalent to the one for EOM Excitation (Section 13), therefore only the semantics of the methods that change will be declared.

### 14.1 Template Module

EOMDIP inherits EOMBase

### 14.2 Uses

EOMBase (10), Integrals (8), WfnRDMs (9)

### 14.3 Access Routine Semantics

`compute_tdm(C)`:

- output:  $out := \sum_{ij} \Gamma_{klji} c_{ij}, \{(i, j) | (i \in [0..nspino - 1]) \wedge (j \in [0..nspino - 1])\}$
- exception: None

#### 14.3.1 Local Functions

`_compute_lhs()`:

- output:  $out :=$   

$$2(h_{jk}\delta_{il} - h_{jl}\delta_{ik} + h_{ik}\gamma_{lj} - h_{il}\gamma_{kj})$$

$$+ 2 \sum_q h_{jq}(\delta_{ik}\gamma_{lq} - \delta_{il}\gamma_{kq}) + \mathbf{v}$$

$$+ 2 \sum_q v_{qjkl}\gamma_{qi} + \sum_r (v_{jilr}\gamma_{kr} - v_{jikr}\gamma_{lr})$$

$$+ 2 \sum_{qr} (v_{iqrk}\delta_{lj} + v_{iqlr}\delta_{kj})\gamma_{qr}$$

$$+ 2 \sum_{qr} (v_{jqrk}\Gamma_{qlri} + v_{jqlr}\Gamma_{qkri})$$

$$+ \sum_{qrs} v_{qjrs}(\delta_{ki}\Gamma_{qlrs} - \delta_{li}\Gamma_{qkrs})$$
- exception: None

`_compute_rhs()`:

- output:  $out := 2\delta_{jk}\gamma_{li} + 2\delta_{il}\gamma_{kj} - 2\delta_{jk}\delta_{il}$
- exception: None

## 15 MIS of EOM DEA Module

The MIS of EOM DEA is equivalent to the one for EOM Excitation (Section 13), therefore only the methods that change are declared.

### 15.1 Template Module

EOMDEA inherits EOMBase

### 15.2 Uses

EOMBase (10), Integrals (8), WfnRDMs (9)

### 15.3 Access Routine Semantics

`compute_tdm(C)`:

- output:  $out := \sum_{ij} (2\delta_{li}\delta_{kj} + 2\delta_{lj}\gamma_{ik} + 22\delta_{ki}\gamma_{jl} + \Gamma_{ijkl})c_{ij}, \{(i, j) | (i \in [0..nspino-1]) \wedge (j \in [0..nspino-1])\}$
- exception: None

#### 15.3.1 Local Functions

`_compute_lhs()`:

- output:  $out := 2(h_{li}\delta_{kj} - h_{ki}\delta_{lj} + h_{ki}\gamma_{jl} - h_{li}\gamma_{jk}) + 2\sum_p (h_{pi}\delta_{lj}\gamma_{pk} + h_{pj}\delta_{ki}\gamma_{pl}) + \mathbf{v} + 2\sum_r v_{lkjr}\gamma_{ir} + \sum_q (v_{qlij}\gamma_{qk} - v_{qkij}\gamma_{ql}) + 2\sum_{qr} (v_{qljr}\delta_{ki} - v_{qkjr}\delta_{li})\gamma_{qr} + 2\sum_{qr} (v_{qlir}\Gamma_{qjrk} - v_{qkir}\Gamma_{qjrl}) + \sum_{pqr} v_{pqjr}(\delta_{li}\Gamma_{pqrk} - \delta_{ki}\Gamma_{pqrl})$
- exception: None

`_compute_rhs()`:

- output:  $out := 2\delta_{li}\delta_{kj} - 2\delta_{li}\gamma_{jk} - 2\delta_{kj}\gamma_{il}$
- exception: None

## 16 MIS of Output module

### 16.1 Module

output

### 16.2 Uses

input (7)

### 16.3 Syntax

#### 16.3.1 Exported Constants

#### 16.3.2 Exported Access Programs

Name	In	Out	Exceptions
dump	fname: ParsedParams, $\Delta E$ :seq( $k:\mathbb{R}$ ), $C$ =seq( $k,n:\mathbb{R}$ ), $\gamma_{n;0k}$ =seq( $k,n,n:\mathbb{R}$ )	str, -	-

### 16.4 Semantics

#### 16.4.1 State Variables

None

#### 16.4.2 Environment Variables

outputFile: A text file

#### 16.4.3 Assumptions

#### 16.4.4 Access Routine Semantics

dump(fname,ParsedParams, $\Delta E,C,\gamma_{n;0k}$ ):

- transition: Write to fname the input parameters from ParsedParams and the results of the calculations:  $\Delta E$ ,  $C$  and  $\gamma_{n;0k}$
- exception: None

### 16.4.5 Local Functions

get\_roots( $\Delta E$ , ParsedParams.eom, roots):

- transition: Select from  $\Delta E$  the number of nonzero values indicated by roots and write them to fname.
- exception: *exc* :=

$\neg(\text{ParsedParams.eom} \in \{\text{"ip"}, \text{"dip"}, \text{"ea"}, \text{"dea"}, \text{"exc"}\}) \Rightarrow \text{ValueError}$

## 17 MIS of Solver Module

### 17.1 Module

solve

### 17.2 Uses

input (7)

### 17.3 Syntax

#### 17.3.1 Exported Constants

#### 17.3.2 Exported Access Programs

Name	In	Out	Exceptions
dense	$\mathbf{A}$ : $\text{seq}(k, k: \mathbb{R})$ , $\text{seq}(k, k: \mathbb{R})$ , $\mathbb{R} > 0$ , orthog: str <i>in</i> {“ <i>symm</i> ”, “ <i>asymm</i> ”}	$\mathbf{B}$ : $\Delta \mathbf{E}: \text{seq}(k: \mathbb{R})$ , tol: $\mathbf{c} = \text{seq}(k, k: \mathbb{R})$	DivideByZero

### 17.4 Semantics

#### 17.4.1 State Variables

#### 17.4.2 Environment Variables

#### 17.4.3 Assumptions

#### 17.4.4 Access Routine Semantics

dense( $\mathbf{A}, \mathbf{B}, \text{tol}, \text{orthog}$ ):

- output:  $\text{out} := \Delta \mathbf{E}, \mathbf{c}$  that satisfies  $\mathbf{A}c_i = \Delta E_i \mathbf{B}c_i, \{i | 0 \leq i \leq k\}$
- exception: DivideByZero

#### 17.4.5 Local Functions

None
